

CC LAB 08 | Desk Calculator

Aim: Lex program to implement a desk calculator with error recovery

LEX -

```
num [0-9]+\.[0-9]*|[0-9]*\.[0-9]+\n\n%{\n%}\n{num} { yylval = (double)atoi(yytext); return num; }\n[ ] {}\n\\n|. { return yytext[0]; }\n%{\n%}
```

YACC -

```
%{\n#include <stdio.h>\n#include <stdlib.h>\n#define YYSTYPE double\nint yylex(void);\nvoid yyerror(char const* s);\nvoid push();\n%}\n%token num\n%left '+' '-'\n%left '*' '/'\n%right UMINUS\n%{\nS : S E '\\n' {printf("Result = %.2f\\n", $2);}\n| S '\\n'\n|\n| error '\\n' { yyerrok; }\n;\nE : E '+' E { $$ = $1 + $3; }\n| E '-' E { $$ = $1 - $3; }\n| E '*' E { $$ = $1 * $3; }\n| E '/' E { $$ = $1 / $3; }\n| '(' E ')' { $$ = $2; }\n| '-' E %prec UMINUS { $$ = -$2; }\n| num { $$ = $1; }\n;\n%{\n#include "lex.yy.c"\nvoid yyerror (char const *s) {\nprintf("reenter previous line:");\n}\nint main()\n{\nprintf("Enter calculation to perform: ");\nyyparse();\nreturn 0;\n}\n}
```

Output:

```
Enter calculation to perform: 5+3-2*2/3
Result = 6.67
abcd
reenter previous line:5+3-2+1+1
Result = 8.00
```
